

Mad

Add notes about things that frustrated you in the last iteration. ✖

it was frustrating with merging issues sometimes

saving reminders local storage

that we need to make last minute design changes

Using Puppeteer for unit testing is frustrating and I felt that this is the part that our lab does not sufficiently cover the most

There wasn't anything frustrating in the last iteration as far as I can remember.

we found out about the updated grading rubric a little late (later than the other groups because I heard it from other people first and asked our TA about it and she responded with the old rubric, then a few days later she told us the rubric changed)

because we all worked on different features, the layout turned out to be a little messy and all the incorrect margins/uncentered texts made the page look not so pretty, which was irritating to look at, but it's easily fixable

For the last iteration, our TA did not show up on time. My teammates and I always got late heads-up so we could not use our group meeting time most effectively.

Sad

Add notes about things that disappointed you in the last iteration. ✖

Felt that catching up with the team status can be not only inefficient but also hard to get

Layout

EXPAND GROUP

our current layout of website is not organized and our color choices are questioned

EXPAND GROUP

For the last iteration, I was not really disappointed at anything but I felt like the end of quarter is coming up super fast. It would have been better if we had more time to work on the project to make our website more professional.

When I realized that my interpretation of the functions of the buttons are wrong, I need to re-write several blocks of codes.

Glad

Add notes about things that excited you in the last iteration. ✖

the website looks great!

EXPAND GROUP

Was able to implement a lot of features that I was not able before through the process of independent research and exploration

EXPAND GROUP

When our codes finally could work, I was so excited. Also, when our group's status video got selected to present to the whole class, I was excited too.

All the codes are clean and organized and easy for later maintenance. All the functions' comments and in-line comments are implemented

EXPAND GROUP

all the members are contributing to the project and the flow is smooth

It was hard to start from scratch for the javascript file to implement the functions of the expense table at first since before in the labs, we were given all the starter codes and instructions

Hard to implement month based visualizations

Outstanding action items

Reminders
Test Cases
Store reminders locally so it isn't lost when page is refreshed
Have a way to rank priority so like up arrows for ordering

Calendar
-Make it work with data
-Test cases

created November 29, 2022

Overall: Add header to the top of team page
Centered visualization and budget so its centered
Test cases
Less words for description / increase width
Change budget remaining to amount left - more intuitive
Less green
Separate budget and visualization
